

Imaging Now at

Rockland and Northern Jersey Endodontics

As we strive to improve our endodontic practice and to take the best possible care of our patients, we have invested in the KODAK 9000 3D extra oral imaging system. This innovative unit provides a two-in-one solution (3D and panoramic) with access to powerful, focused-field 3D images and offers unprecedented x-ray views of the oral cavity. The anatomical detail and viewing capabilities of 3D imaging offer a wide range of diagnostic possibilities.

Periapical and panoramic radiography have been augmented by the recent introduction of high-resolution cone beam computed tomography (CBCT), allowing 3D assessment of **root canal morphology, retreatment cases, root resorption and root fractures**. The KODAK 9000 3D system offers the highest resolution imaging capabilities on the market today.

As the 9000 system focuses only on the area in need of diagnosis, the amount of radiation exposure is significantly reduced. The three-dimensional images are generated in standard DICOM format for easy image sharing, should we need to collaborate on a case.

Comfortable patient positioning and wheelchair accessibility make this unit patient-friendly. We feel that this new unit helps us significantly improve patient care, and appreciate the trust you put in our practice. We look forward to continuing our mutually beneficial relationship for many years to come.
